BITEWISE

Recording Script

Full platform walkthrough — landing page through SmartPantry AI, narration and on-screen actions.

BiteWise · Internal walkthrough script · July 26, 2026

CONTENTS

How to use this script

Part 1 — Landing Page (45–60 sec)

Part 2 — Sandbox Entry → Platform Chooser (30 sec)

Part 3 — NutriOrder AI

Part 4 — Switching to SmartPantry AI

Closing (20–30 sec)

How to use this script

This is a shot-by-shot recording script. Each section has two columns of information: **SAY** (narration to speak, written in first person, ready to read or paraphrase) and **DO** (exactly what to click or show on screen). Sections are ordered exactly as a first-time viewer would experience the product — landing page, sandbox demo, NutriOrder AI end-to-end, then SmartPantry AI end-to-end.

Suggested total runtime: **9–12 minutes**. Each section header notes an approximate duration — treat these as a pace guide, not a hard rule.

Part 1 — Landing Page (45–60 sec)

DO: Open `localhost:3000` (or the production URL) at the hero section.

SAY:

“This is BiteWise — one food intelligence platform, two focused products. NutriOrder AI is a personal health guide: it tracks your goals and helps you order meals that actually close the gap to them. SmartPantry AI is your household’s kitchen intelligence — it knows what’s in your pantry, what’s running low, what’s about to expire, and what you can cook right now with what you already have.

Both products are built on Swiggy MCP — the Model Context Protocol servers Swiggy exposes for food ordering and Instamart grocery delivery. Every recommendation you’ll see is grounded in real tool calls to those servers, not a static catalog.”

DO: Scroll through the landing page — hero stats (2 focused products, verified test count, intelligence layers), then briefly show the NutriOrder and SmartPantry showcase sections before the CTAs.

SAY:

“Let’s go in as a guest and walk through the whole thing — starting from the very first screen a brand-new user sees.”

Part 2 — Sandbox Entry → Platform Chooser (30 sec)

DO: Click “Try Sandbox Demo.” Wait for the platform chooser to load.

SAY:

“This is the very first thing any new user sees: ‘What are you here for today?’ Not a settings screen, not a login form — a direct question. NutriOrder AI keeps your goals on track, SmartPantry AI keeps your kitchen stocked, and you can switch between them anytime from the sidebar once you’re in. This screen only shows once per browser — after you pick, returning visits go straight to whichever product you used last.”

DO: Click “Open NutriOrder AI.”

Part 3 — NutriOrder AI

3.1 Onboarding Wizard (60–75 sec)

SAY:

“Because this is a first-time profile, we’re dropped straight into a guided setup — not a wall of fields, a five-step wizard.”

DO: Step through each screen, narrating as you go:

- **Welcome** — *“Three quick steps: biometrics, goals and diet, and how you want meals ranked. Then the Coach starts tracking, and every recommendation is actually built for you — not guessed.”*

- **Biometrics** — enter age/height/weight, **press Enter to move between fields** — *“Age, height, weight, activity level — this feeds a real BMR/TDEE calculation, not a placeholder number.”*
- **Goals & Diet** — pick a fitness goal, diet preference, a cuisine or two — *“Fat loss, maintenance, or muscle gain — each maps to a different calorie and protein target.”*
- **Ranking** — show the six sliders — *“This is the part most food apps don’t give you: you decide how meals get ranked. Protein focus, calorie compliance, budget, delivery speed, restaurant rating, and how much to penalize low-confidence macro estimates — six independent weights, and they’re used for real in the ranking pipeline, not just cosmetic.”*
- **Confirm** — click **“Let’s Eat Smart.”** — *“That single button both starts real tracking and unlocks ordering — which is exactly the point: this isn’t just a tracker, and it isn’t just a food app either.”*

3.2 Coach Hub — the home screen (60–75 sec)

SAY:

“This is home. Not a search box — your actual state. Today’s progress against your calorie and protein targets, a streak badge once you’ve got one, and this card: ‘What do you need next?’ That’s not a canned suggestion — it computes your remaining calorie and protein gap for today and re-runs the full recommendation pipeline against just that gap.”

DO: Click **“Suggest My Next Meal”** if available, or point out the weekly trend chart and weight trend card.

SAY:

“Below that: a 7-day protein-vs-target trend, and a weight trend you can log straight from here. Everything on this page is real data pulled from the backend — there’s no mock content sitting on the home screen.”

3.3 Find Food — search & order (90–120 sec)

DO: Click **“Find Food”** in the sidebar.

SAY:

“This is where ordering actually happens — deliberately not the first thing you see anymore. Notice the ‘Today so far’ strip: it carries your progress over from Coach, so this never feels disconnected from the tracking side.”

DO: Select a delivery address.

SAY:

“Selecting an address starts a real order session against Swiggy MCP — but on purpose, nothing searches yet. No recommendations appear until I actually ask for something.”

DO: Type a query (e.g. “high protein grilled chicken”) or click a suggested prompt chip, then submit.

SAY:

“Now it searches — and ranks results using the six weights from onboarding, plus the live gap from Coach. Each card shows a match score, macros, and why it was picked.”

DO: Select a recommendation, show the cart review — restaurant, payment method (COD), any coupon, and the safety-cap banner.

SAY:

“Before anything is placed, there’s a full cart review: restaurant, payment method, applicable coupons, and a hard safety check — orders at or above ₹1000 are blocked outright, this is the Swiggy Builders Club cap, and it’s enforced server-side, not just in the UI. I have to explicitly confirm before the place-order button even enables.”

DO: Check the confirmation box, click **“Place COD Order on Swiggy,”** show the tracking view (Placed → Accepted → Preparing → Arriving).

SAY:

“Once placed, this becomes a live tracking view — and it stays accessible: if I navigate to Coach or anywhere else while the order’s in flight, there’s a small reminder banner, but the rest of the app keeps working normally. It doesn’t block the whole product just because one order is active.”

3.4 History & Preferences (30 sec)

DO: Click **“History,”** then **“Preferences.”**

SAY:

“History is every order session, most recent first. Preferences is where the same biometrics and ranking sliders from onboarding live permanently — you’re never locked into your first-run answers.”

Part 4 — Switching to SmartPantry AI

DO: Open the sidebar’s product switcher, choose **SmartPantry AI**.

SAY:

“Now let’s switch products entirely. Same account, completely different intelligence underneath.”

4.1 Onboarding Wizard (75–90 sec)

SAY:

“Same idea as NutriOrder — a first-time setup, but the question here is different: what do you actually have, right now, in your kitchen?”

DO: Step through:

- **Stock step** — *“A category-grouped checklist, everything checked by default — tap off what you don’t actually have, and hitting Continue immediately stocks your real pantry. This solves a real chicken-and-egg problem: an empty pantry can’t power any pantry-aware suggestion, so day one has to seed real state before anything else can work.”*
- **Cook-query step** — type a dish (e.g. “butter chicken tonight”), click **“Check it”** — *“And here’s the payoff, immediately: it checks that dish against what I just stocked — coverage percentage, exactly what’s missing — before onboarding is even finished.”*
- **Household step** — *“Optionally add family members with their own diet or allergies — this affects recipe filtering platform-wide, not just for this one search.”*

DO: Click **“Take Me to My Kitchen.”**

4.2 Kitchen Hub — the home screen (60–75 sec)

SAY:

“This is SmartPantry’s home — and just like Coach, it leads with state, not a search box. Low-stock and expiring-soon alerts at the top — real data computed from actual pantry rows, not a generic warning.”

DO: Expand the alerts panel if collapsed.

SAY:

“Then ‘What Can I Cook Today?’ — every recipe scored against my real stock, sorted so anything using a soon-to-expire ingredient surfaces first. Coverage percentage, missing ingredients, and one tap to add the gap to my grocery list.”

DO: Click “**Add missing to grocery list**” on a recipe, show the inline confirmation.

SAY:

“And only after all of that — the composer. ‘Craving something specific?’ This is the same intent-resolution engine from onboarding: name a dish, and it’s checked against pantry before anything about ordering comes up.”

4.3 Pantry (30 sec)

DO: Click “**Pantry**” in the sidebar.

SAY:

“The Pantry page is the ground truth everything else reads from — qualitative stock levels, not exact quantities, by design, to keep logging fast. Category, expiry tracking, and a one-tap stock-level adjuster.”

4.4 Grocery & Instamart Checkout (60 sec)

DO: Click “**Grocery**,” show the list, click “**Build Cart Preview**,” select an address, show matched Instamart products and total.

SAY:

“The grocery list feeds straight into a real Instamart checkout flow — same safety pattern as NutriOrder’s food ordering: a ₹99 to ₹1000 order band, an explicit confirmation checkbox, and only then does ‘Place COD Order on Instamart’ become clickable.”

DO: Confirm and place the order, show the tracking timeline.

SAY:

“Once placed, purchased items automatically restock the pantry back to full — closing the loop completely: track state, notice a gap, buy the gap, and the state updates itself.”

4.5 Household (20 sec)

DO: Click “Household.”

SAY:

“And finally, Household — the same family-member management from onboarding, plus a combined nutrition view across everyone in the home.”

Closing (20–30 sec)

SAY:

“That’s BiteWise end to end — two products, one platform, both built on real Swiggy MCP tool calls with hard safety caps and explicit confirmation at every checkout. Every number you saw today — coverage percentages, macro targets, expiry countdowns — came from real computation against real data, not placeholder content. Thanks for watching.”

DO: End recording on the Kitchen hub or Coach hub, whichever product you want to leave as the final frame.
